## Mobile Workforce Solutions for Construction

### Automate Your Daily Reporting!

Streamline operations and boost productivity by using PowerTrack mobile workforce software to automate your daily reporting requirements. Using smartphones, tablets or rugged handheld terminals, your supervisors can submit their daily field reports faster, easier and more accurately.

PowerTrack consists of a server application and client software running on a variety of platforms including Android, iOS and Windows devices, tablets, laptops or PC workstations. In addition, the optional PowerTrack for Web client allows for use of virtually any browser on laptops or PC's for data collection. Remote devices communicate using a wireless (WI-FI) network or commercial cellular service providers.

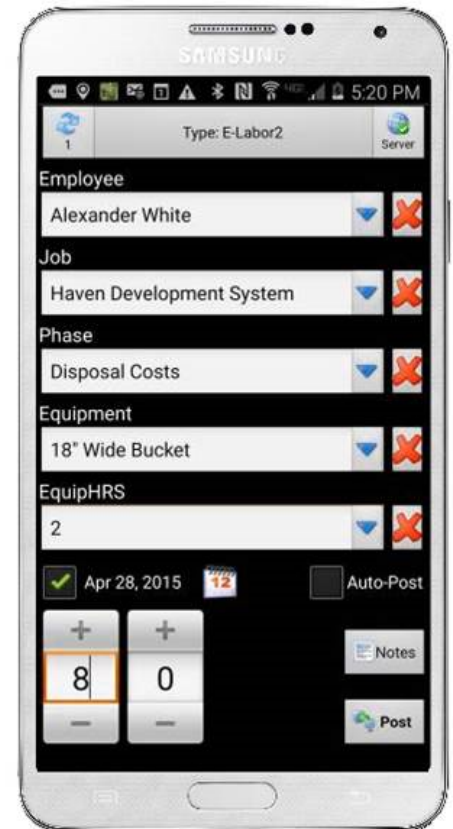

PowerTrack is a versatile and easy-to-use program that replaces time-consuming and sometimes illegible paper reporting with a more accurate and reliable system.

#### How it Works

Current employee, equipment, material and job information from the computer system is automatically downloaded to your supervisors' remote devices. On the job, the remote devices are used to quickly and accurately complete the daily report. The system can be set up so the user sees only their information to make the process very quick.

The user selects the type of information they are entering and is presented with the necessary data prompts. A few simple selections from a list or scans of a barcode and the user has completed the daily report. Using the integrated scanner, keypad, user-selectable lists or search functions on the remote device makes data entry simple and accurate. The supervisor can view and edit the posted transactions on the remote device before the data is transmitted to the PowerTrack server.

### Get the PowerTrack Edge!

- Use one device to collect daily reporting requirements
- Easy system setup – no programming required
- Configure user-definable transaction types, prompt titles and other settings
- Supports bar code scanning, photo and signature capture, integrated GPS and adding notes using voice
- Collect time data as durations, or real time – record start times and job changes as they occur
- Allocation Assist - allocate employee time to jobs with software assistance
- Powerful transaction viewing and editing capabilities
- Integrates with any ODBC data source, including most job cost accounting systems

During data synchronization, the information collected in the

field is uploaded to the server. New employee and job data, configuration changes, etc., are automatically downloaded to the remote device.

Once the information is reviewed, the collected data can be exported to the company's job cost accounting package.

### Tailor the System for Competitive Advantage

PowerTrack is the only product in the industry that allows you to create new data entry screens and define data source connectivity within the application, requiring no programming. You can tailor the system to your unique operation or implement new functionality as your requirements change. Through configuration settings, you can define screens, prompt buttons and field names. For each prompt button, you can define data entry methods, source data (select list) connectivity and other attributes.

#### It's a better way: PowerTrack pays off

"We are a growing company that needed a better way of collecting man-hours. PowerTrack pays off because we spend far less time on data entry and on fixing mistakes."

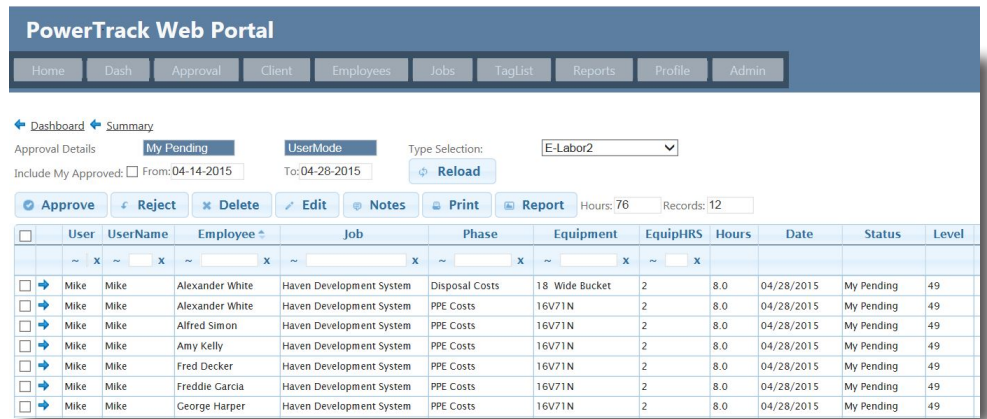

Wendie Ruprecht, Tedesco Construction, Reno, NV

### About POSDATA Group

POSDATA Group Inc. is a national leader in mobility and remote workforce management solutions. Visit [www.powertrackmobile.com](http://www.powertrackmobile.com) to learn more about solutions for the construction industry.

Review and Approve via common web browsers

### Time Capture Options

Time collection can also be set up to meet your specific business requirements using one or more of the following options:

- Clock-in and Clock-out – records employees' clock in and clock out for the day
- Start Time/End Time – real time collection of an employee's job start and changes throughout the day – system automatically calculates duration for each task/phase
- Duration – directly enter the times to be assigned to specific tasks
- Allocation Assist – works in combination with clock-in/clock-out; directs user on how many hours to allocate to task/phase

### Review and Approve

All transaction records uploaded from the remote device to the PowerTrack server may be reviewed, edited and approved using the PowerTrack

Approval application. This application is available as part of our web portal for maximum accessibility by approvers. Records can be filtered by date range, transaction type, employees or job, providing a variety of ways to analyze the data. The approval application can be configured for multiple levels of approval.

PowerTrack also offers a standard set of reports for time reporting. In addition, custom reports can be integrated into the PowerTrack report launcher.

### Software Integration

The PowerTrack software easily integrates with existing accounting systems. To keep all information current, PowerTrack automatically syncs with the accounting system's database. PowerTrack sends approved transaction information either directly to the accounting system's database, or to a text file for later upload.
